[Hiring Manager Name]

[Team / Function]

[Bank Name]

| Application: Quantitative Analyst (Machine Learning & Data Science)

Dear Hiring Manager,

I am writing to apply for the **Quantitative Analyst (Machine Learning & Data Science)** position at **[Bank Name]**. I hold a **BSc in Mathematics and Physics**, am currently a **Discover Graduate Trainee at Vodacom Financial Services**, and have applied ML on both cloud analytics engagements (Vodafone Portugal, on **GCP, BigQuery, and Vertex AI**) and on a self-built alternative credit-scoring model (**KasiScore**). I would welcome the chance to bring that quantitative and ML skill set to your team.

My core technical stack is closely aligned with a modern banking quant function: **Python (pandas, NumPy, scikit-learn), SQL, and cloud analytics on AWS, GCP, BigQuery, and Vertex AI**. On the Vodafone Portugal engagement I extracted enterprise-scale datasets from BigQuery, performed cleansing and EDA on GCP, and applied statistical and machine-learning techniques — regression, classification, clustering, and model evaluation — to generate business insights. Within Vodacom Financial Services I deliver quantitative analysis and executive reporting into Risk Management, Technology Assurance, and Steering Committees, building dashboards in Power BI and automating workflows with Python and advanced Excel.

My strongest signal for a banking ML quant team is **KasiScore** inside the KasiKash platform: an alternative credit-scoring engine I built end-to-end on township SME transaction data. Designing it required **feature engineering, model selection, evaluation, and productionisation** — the same lifecycle a bank's credit or behavioural model goes through. It also forced me to think carefully about **data quality, model monitoring, and predictive performance under real-world data**, which I understand are central concerns for any quantitative model in a regulated banking environment.

I am particularly interested in **[Bank Name]** because of your work on **[specific team / product / research area — e.g. credit risk models, retail behavioural scoring, market risk analytics, decision science]**. Joining a strong, technically rigorous quant team is exactly what I want next in my career, and I am eager to contribute to **predictive modelling, model development and validation, risk analytics, and data-driven decision science**. I have attached my CV and would welcome the opportunity to discuss the role further.

Thank you for your time and consideration.

Kind regards,

Sinethemba Mvelase
